#### Abstract

In this study, we estimate the resolvent of the two bodies Shrodinger operator perturbed by a potential of Coulombian type on Hilbert space when h tends to zero. Using the Feschbach method, we first distorted it and then reduced it to a diagonal matrix. We considered a case where two energy levels cross in the classical forbidden region. Under the assumption that the second energy level admits a non degenerate point well and virial conditions on the others levels, a good estimate of the resolvent were observed.

$\underline{\text { Key words: Distorsion, eigenvalues, estimation, resolvent, resonances }}$

## INTRODUCTION

The Born-Oppenheimer approximation technical ${ }^{[1]}$ has instigated many works one can find in bibliography the recent papers like ${ }^{[2-5]}$.

It consists to study the behaviour of a many body systems, in the limit of small parameter $h$ as the particles masses (masses of nuclei) tends to infinity; (see the references therein for more information), we can describe it with a Hamiltonian of type $\mathrm{P}=-\mathrm{h}^{2} \Delta_{\mathrm{x}}-\Delta_{\mathrm{y}}+\mathrm{V}(\mathrm{x}, \mathrm{y})$ on $\mathrm{L}^{2}\left(\mathrm{IR}_{\mathrm{x}}^{3} \times \mathrm{IR}_{\mathrm{y}}^{3 \mathrm{p}}\right)$, when h $\rightarrow 0$ and $V$ denote the interaction potentials between the nuclei of the molecule and the nuclei electrons.
The idea is to replace the operator
$\mathrm{Q}(\mathrm{x})=-\Delta_{\mathrm{y}}+\mathrm{V}(\mathrm{x}, \mathrm{y})$ (in, $\mathrm{L}^{2}\left(\mathrm{IR}_{\mathrm{y}}^{3 \mathrm{p}}\right)^{x}$ fixed) by the so-called electronic levels which be a family of its discrete eigenvalues: $\lambda_{1}(x), \lambda_{2}(x), \lambda_{3}(x), \ldots$ and to study the operators $P$ which can be approximativelly given by
$-\mathrm{h}^{2} \Delta_{\mathrm{x}}+\lambda_{\mathrm{j}}(\mathrm{x})$, on $\mathrm{L}^{2}\left(\mathrm{IR}_{\mathrm{x}}^{3}\right)$.
Martinez and Messirdi's works, are about spectral proprieties of $P$ near the energy level $\mathrm{E}_{0}$ such that $\inf _{\mathrm{R}^{\mathrm{n}}} \lambda_{\mathrm{j}}$
$\leq \mathrm{E}_{0}$. Martinez in ${ }^{[6]}$, studies the case where $\lambda_{1}(\mathrm{x})$ admits a nondegenerate strict minimum at some energy level $\lambda_{0}$, the eigenvalues of P near $\lambda_{0}$ admits a complete asymptotic expansion in half-powers of $h^{[2]}$.

Messerdi and Martinez ${ }^{[7]}$ considers the case where $\lambda_{2}$ admits a minimum, such appears resonances for $P$. He gives an estimation of the resolvent of $O\left(\mathrm{~h}^{-1}\right)$ at the neighbourhood of 0 .

In this study we try to generalize this work to approximate the resolvent of $P$ where $V$ is a potential of Coulombian type at the neighbourhood of a point $\mathrm{x}_{0} \neq 0$.

In fact, we estimate the resolvent of the operator $\mathrm{F}_{\mu}^{\varsigma}$, given by a reduction of the distorted operator $\mathrm{P}_{\mu}^{\varsigma}$, of $P$ modified by a truncature $\varsigma^{[8]}$; and we try to have a good evaluation of the order of $O\left(\mathrm{~h}^{-1 / 2}\right)$.

We apply the Feshbach method to study the distorted operator $\mathrm{P}_{\mu}^{\varsigma}$ which allows us to goback to the initial problem and we put the virial conditions on $\lambda_{1}$ and $\lambda_{3}$.

## Hypothesis and results

Hypothesis: Let the operator
$\mathrm{P}=-\mathrm{h}^{2} \Delta_{\mathrm{x}}-\Delta_{\mathrm{y}}+\mathrm{V}(\mathrm{x}, \mathrm{y})$
on $\mathrm{L}^{2}\left(\operatorname{IR}_{\mathrm{x}}^{3} \times \mathrm{IR}_{\mathrm{y}}^{3 \mathrm{p}}\right)$, when $h$ tends to $0 . \quad V(x, y)$ $=\mathrm{V}\left(\mathrm{x}, \mathrm{y}_{1}, \mathrm{y}_{2}, \mathrm{y}_{3}, \ldots, \mathrm{y}_{\mathrm{p}}\right)$ is an interaction potential of Coulombian type
$V(x, y)=\frac{\alpha}{|x|}+\sum_{j=1}^{p}\left[\frac{\alpha_{j}^{+}}{\left|y_{j}+x\right|}+\frac{\alpha_{j}^{-}}{\left|y_{j}-x\right|}\right]+\sum_{\substack{j, k=1 \\ j \neq k}}^{p} \frac{\alpha_{j k}}{\left|y_{j}-y_{k}\right|}$
where $\alpha, \alpha_{\mathrm{j}}^{ \pm}, \alpha_{\mathrm{jk}}$ are real constants, $\alpha>0$ ( $\alpha_{\mathrm{j}}^{ \pm}$is the charges of the nuclei).
It is well known that $P$ with domain $\mathrm{H}^{2}\left(\mathrm{IR}_{\mathrm{x}}^{3} \times \mathrm{IR}_{\mathrm{y}}^{3 \mathrm{p}}\right)$ is essentially self-adjoint on
$L^{2}\left(\operatorname{RR}_{x}^{3} \times \operatorname{IR}_{y}^{3 p}\right)$.

Corresponding Author: Sabria Bouheroum- Mentri, Department of Mathematics, University of Annaba B.P. 12 Annaba 23000 Algeria

For $\quad \mathrm{x} \neq 0, \quad \mathrm{Q}(\mathrm{x})=-\Delta_{\mathrm{y}}+\mathrm{V}(\mathrm{x}, \mathrm{y})$ with domain and for $\left.\delta\right\rangle 0$, we also note by:
$H^{2}\left(\operatorname{IR}_{y}^{3 p}\right)$ is essentielly self-adjoint on $L^{2}\left(\operatorname{IR}_{y}^{3 p}\right)$

Remark 1.1: The domain of $Q(x)$ is independent of $x$. To describe our main results we introduce the following assumptions:
(H1) $\forall \mathrm{x} \in \mathrm{IR}^{3 \mathrm{n}} \backslash\{0\}$, \# $\sigma_{\text {disc }}(\mathrm{Q}(\mathrm{x})) \geq 3$
Let $\lambda_{0}$ an energy level such that: $\lambda_{\mathrm{j}} \cap\left[-\infty, \lambda_{0}[\leq 3\right.$, denoting $\lambda_{1}(x), \lambda_{2}(x), \lambda_{3}(x)$ the first three eigenvalues of $Q(x)$.
(H2) we assume that the first tree eigenvalues $\lambda_{j}$, $\forall \mathrm{j} \in\{1,2,3\}$ are simple at infinity:
$|\mathrm{x}| \geq \mathrm{C} \Rightarrow \inf _{\mathrm{j}, \mathrm{k} \in\{1,2,3\}}\left|\lambda_{\mathrm{j}}(\mathrm{x})-\lambda_{\mathrm{k}}(\mathrm{x})\right| \geq \frac{1}{\mathrm{C}}$
and
$\left.\underset{\mathrm{j}, \mathrm{k} \in\{1,2,3\}}{\lim } \operatorname{dist}\left(\lambda_{\mathrm{j}}(\mathrm{x})-\lambda_{\mathrm{k}}(\mathrm{x})\right) \backslash\left\{\lambda_{1}(\mathrm{x}), \lambda_{2}(\mathrm{x}), \lambda_{3}(\mathrm{x})\right\}\right\rangle 0$
this means
$\left.\exists \delta_{1}\right\rangle 0, \forall \mathrm{x} \neq 0$, and $\quad \lambda \in \sigma(\mathrm{Q}(\mathrm{x})) \backslash\left\{\lambda_{1}(\mathrm{x}), \lambda_{2}(\mathrm{x}), \lambda_{3}(\mathrm{x})\right\}$, we have
$\inf _{1 \leq j \leq 3}\left|\lambda-\lambda_{j}(x)\right| \geq \delta_{1}$
Remark1.2: By Reed-Simon' results ${ }^{[9]}$, the first eigenvalue is automatically simple.
(H3) we suppose that $\exists \mathrm{c}\rangle 0$ such that

$$
\begin{equation*}
\forall \mathrm{x} \in \mathrm{IR}^{3} \backslash\{0\}, \quad \lambda_{\mathrm{j}} \leq \mathrm{c}+\frac{\alpha}{\mathrm{x}}, \quad \mathrm{j} \in\{1,2,3\} \tag{5}
\end{equation*}
$$

Remark 1.3: This hypothesis is still true for $\alpha_{ \pm}\langle 0$; $\lambda_{1}$ also verifies (H3) and we can see with a simple computation that there exists $\mathrm{c}_{1}$ such that for all $x \neq 0$
$\lambda_{1}(\mathrm{x}) \geq-\mathrm{c}_{1}+\frac{\alpha}{|\mathrm{x}|}$
(H4) We are in the situation where $\lambda_{2}(x)$ admits a nondegenerate strict minimum; creating a potential well
of the shape $\Gamma:\left\{\begin{array}{l}v_{0}=\inf _{x \in \mathbb{R}-\{0\}} \lambda_{2}(x), \quad v_{0}\left\langle\lambda_{0}(x)\right. \\ \left.\left.\lambda_{2}^{-1}\left(v_{0}\right)=r_{0}, \lambda_{2}(x)\right\rangle 0, \quad \lambda_{2}^{\prime \prime}\left(r_{0}\right)\right\rangle 0\end{array}\right.$
$\exists \delta_{2}>0$ such that
$\forall \mathrm{x} \in \mathrm{R}^{3} \backslash\{0\}, \quad \lambda_{1}(\mathrm{x})+\delta_{2}\left\langle\min \left\{\lambda_{2}(\mathrm{x}), \lambda_{3}(\mathrm{x})\right\}\right.$
we note by

$$
K=\left\{x \in R, \lambda_{2}(x)=\lambda_{3}(x)\right\}
$$

$\mathrm{K}_{\delta}=\{\mathrm{x} \in \operatorname{IR}, \operatorname{dist}(\mathrm{x}, \mathrm{K}) \leq \delta\}$
Let $\left.\left.\delta_{0}\right\rangle \delta_{1}\right\rangle 0$ such that

* $\quad \mathrm{K}_{\delta_{0}} \backslash \mathrm{~K}_{\delta_{1}}$ is simply connex
* $\quad \mathrm{K}_{2 \delta_{0}} \cap \mathrm{U}=\varnothing$
* The connex composites of $\mathrm{IR}^{3} \backslash \mathrm{~K}_{\delta_{1}}$ are simply connex
(H5) Virial Conditions
It exists d$\rangle 0$ such that for $\mathrm{j} \in\{2,3\}$,
The resonances of $P$ are obtained by an analytic distorsion introduced by Hunziker ${ }^{[8]}$ and so they are defined as complex numbers $\rho_{j}\left(j=1, \ldots, N_{0}\right)$ such that for all $\varepsilon\rangle 0$ and $\mu$ sufficiently small, $\operatorname{Im} \mu>0$ $\rho_{\mathrm{j}} \in \sigma_{\text {disc }}(\mathrm{P} \mu){ }^{[3]}$. We denote de set of the resonances of $P$ by: $\sigma(\mathrm{P})=\underset{\mathrm{Im} \mu\langle 0, \mu\langle\varepsilon \varepsilon}{\cup} \sigma_{\text {disc }}\left(\mathrm{P}_{\mu}\right)$
Where $P_{\mu}$ is obtained by the analytic distorsion satisfying: $P_{\mu}=U_{\mu} P_{\mu} U_{\mu}^{-1}$. So, $P_{\mu}$ can be extended to small enough complex values of $\mu$ as an analytic family of type ${ }^{[9]}$.

The analytic distorsion $\mathrm{U}_{\mu}$, for $\mu$ small enough associated to $v$ is defined on $\mathrm{C}_{0}^{\infty}\left(\operatorname{IR}_{\mathrm{x}}^{3} \times \mathrm{IR}_{\mathrm{y}}^{3 \mathrm{p}}\right)$ by $\mathrm{U}_{\mu} \varphi(\mathrm{x}, \mathrm{y})=\varphi\left(\mathrm{x}+\mu \mathrm{v}(\mathrm{x}), \mathrm{y}_{1}+\mu \mathrm{v}\left(\mathrm{y}_{1}\right), \ldots, \mathrm{y}_{\mathrm{p}}+\mu \mathrm{v}\left(\mathrm{y}_{\mathrm{p}}\right)\right)|\mathrm{J}|^{1 / 2}$ where $\mathrm{J}=\mathrm{J}(\mathrm{x}, \mathrm{y})=\operatorname{det}\left(1+\mu \operatorname{Dv}(\mathrm{x}) \prod_{\mathrm{j}=1}^{\mathrm{p}} \operatorname{det}\left(1+\mu \mathrm{D}\left(\mathrm{y}_{\mathrm{j}}\right)\right)\right.$ is the Jacobien of the transformation $\Psi_{\mu}:(\mathrm{x}, \mathrm{y}) \rightarrow\left(\mathrm{x}+\mu \mathrm{v}(\mathrm{x}), \mathrm{y}_{1}+\mu \mathrm{v}(\mathrm{x}), \ldots, \mathrm{y}_{\mathrm{p}}+\mu \mathrm{v}(\mathrm{x})\right)$ and $v \in C^{\infty}\left(R^{3}\right)$ is a vector field satisfying :
$\exists N\rangle 0$, large enough such that: $\left\{\begin{array}{l}v(x)=0, \text { si }|x| \leq \frac{2}{N} \\ v(x)=x, \text { si }|x| \geq r_{0}-\varepsilon^{\prime}\end{array}\right.$
$\left(\varepsilon^{\prime}\right\rangle 0$, small enough, $\left.\left.\left|\mathrm{r}_{0}\right|\right\rangle \frac{3}{\mathrm{~N}}+\varepsilon^{\prime}\right)$.

Remark 1.4: The distorsion is close to the potential well.

We localise our operator near the well $\mathrm{v}_{0}$ by introducing a truncate function $\varsigma \in \mathrm{C}^{\infty}\left(\mathrm{IR}^{3}\right)$ satisfying:
$\left\{\begin{array}{l}\varsigma=1, \text { si }|x| \geq \frac{2}{N} \\ \varsigma=0, \text { si }|x| \leq \frac{3}{2 N}\end{array}\right.$
fixing $\left.\alpha_{0}\right\rangle \mathrm{v}_{0}$, we set
$\mathrm{Q}_{\mu}^{\varsigma}(\mathrm{x})=-\mathrm{U}_{\mu} \Delta_{\mathrm{y}} \mathrm{U}_{\mu}^{-1}+\varsigma(\mathrm{x}) \mathrm{V}_{\mu}(\mathrm{x}, \mathrm{y})+(1-\varsigma(\mathrm{x})) \alpha_{0}$
$\mathrm{V}_{\mu}(\mathrm{x}, \mathrm{y})=\left(\mathrm{x}+\mu \mathrm{v}(\mathrm{x}), \mathrm{y}_{1}+\mu \mathrm{v}(\mathrm{x}), \ldots, \mathrm{y}_{\mathrm{p}}+\mu \mathrm{v}(\mathrm{x})\right)$
We also denote:
$\mathrm{P}_{\mu}^{\varsigma}=-\mathrm{h}^{2} \mathrm{U}_{\mu} \Delta_{\mathrm{x}} \mathrm{U}_{\mu}^{-1}+\mathrm{Q}_{\mu}^{\varsigma}(\mathrm{x})$
With domain $\mathrm{H}^{2}\left(\mathrm{IR}_{\mathrm{x}}^{3}\right)$.

Remark1.5: Like in ${ }^{[10]}$, near $v_{0}, \sigma\left(\mathrm{P}_{\mu}\right)$ and $\sigma\left(\mathrm{P}_{\mu}^{\varsigma}\right)$ coincide up to exponentially small error terms. For this we will study $\mathrm{P}_{\mu}^{\varsigma}$ instead of $\mathrm{P}_{\mu}$.

## RESULTS

Here we write the results of our works as following:

Theorem 1.6: Under assumptions (H1) to (H5) and for $\mu \in \mathrm{C},|\mu|$ and $h$ small enough, we have
$\left\|\left(\mathrm{F}_{\mu}^{\varsigma}-\mathrm{z}\right)^{-1}\right\|=\mathrm{O}\left(\mathrm{h}^{-1 / 2}\right)$
where $F_{\mu}^{\varsigma}$ is the Feshbach reduced operator of $P_{\mu}^{\varsigma}$ verifying
$\mathrm{F}_{\mu}^{\varsigma}=-\frac{\mathrm{h}^{2}}{(1+\mu)^{2}} \Delta_{\mathrm{x}} \mathrm{I}+\mathrm{M}_{\mu}^{\varsigma}+\tilde{\mathrm{R}}_{\mu}^{\varsigma}$ and the error $\tilde{\mathrm{R}}_{\mu}^{\varsigma}$ is satisfying: $\left\|\tilde{R}_{\mu}^{\varsigma}\right\|_{L\left(H^{m} \oplus H^{m}, H^{m-1} \oplus H^{m-1}\right.}=O\left(h^{2}\right)$
We need for our proof the main important theorem for the operator $\mathrm{P}_{2, \mu}^{\varsigma}$ which is the distorsion of the operator $\mathrm{P}_{2, \mu}$ :
$\mathrm{P}_{2, \mu}^{\varsigma}=-\mathrm{h}^{2} \mathrm{U}_{\mu} \Delta_{\mathrm{x}} \mathrm{U}_{\mu}^{-1}+\lambda_{2}(\mathrm{x}+\mu \mathrm{v}(\mathrm{x}))$
at the neighbourhood of point $x_{0}$ of the well such that ( $\left.\forall \varepsilon^{\prime}\right\rangle 0$,small enough, $\left|\left|\mathrm{x}_{0}\right|\right\rangle \mathrm{r}_{0}+\varepsilon^{\prime}$ ), the distorsion $\mathrm{P}_{2, \mu}$ is in fact a dilatation of angle $\theta$ such that $\mathrm{e}^{\theta}=(1+\mu)$. We denote it by $\mathrm{P}_{2, \theta}{ }^{[11]}$ and is defined by
$\mathrm{P}_{2, \theta}=-\mathrm{h}^{2} \Delta_{\mathrm{x}}+\lambda_{2}\left(\mathrm{xe}^{\theta}\right)$
Let $e_{j}, j=1, \ldots, N_{0}$ be the eigenvalues of the operator $\left.\mathrm{P}_{0}=-\frac{\mathrm{d}^{2}}{\mathrm{dr}^{2}}+\frac{1}{2} \lambda_{2}^{\prime \prime}\left(\mathrm{r}_{0}\right)\left(\mathrm{r}-\mathrm{r}_{0}\right)^{2}\right)$ and $\gamma_{\mathrm{j}}$ complex circles centred at $e_{j} h$.

Theorem 1.7: Under assumptions (H1)- (H5), for $\theta \in \mathrm{C},|\theta|$ and $h$ small enough and for ( $\left.\forall \varepsilon^{\prime}\right\rangle 0$,small enough, $\left|\left|x_{0}\right|\right\rangle r_{0}+\varepsilon^{\prime}$ ), the resolvent of the distorted operator defined by (9) satisfies the estimate
$\left\|\left(\mathrm{P}_{2, \theta}-\mathrm{z}\right)^{-1}\right\|=\mathrm{O}\left(\mathrm{h}^{-1 / 2}\right)$, uniformly for $z \in\left[-\varepsilon^{\prime}-x_{0}, C_{0} h-x_{0}\right]$ outside of the $\gamma_{j}$.

Before we prove this theorem, we introduce the socalled Grushin problem associated to the distorted operator $P_{\mu}$.

The reduced Feshbach operator: Now, we try to reduce the operator $\mathrm{P}_{\mu}^{\varsigma}$ by the Feshbach method into a matricial operator of type: $-\frac{h^{2}}{(1+\mu)^{2}} \Delta_{x} I+M_{\mu}^{\varsigma}+\tilde{R}_{\mu}^{\varsigma}$
where $M_{\mu}^{\varsigma}$ is the matrix of eigenvalues of $Q_{\mu}^{\varsigma}$ and $\tilde{R}_{\mu}^{\varsigma}$ is the remainder of order $O\left(\mathrm{~h}^{2}\right)$

The study of the distorted operator $\mathrm{P}_{\mu}^{\varsigma}$ : We begin our study by the operator $\mathrm{Q}_{\mu}^{\varsigma}$ which is defined by: $\mathrm{Q}_{\mu}^{\varsigma}=\mathrm{U}_{\mu} \mathrm{Q}(\mathrm{x}+\mu \mathrm{v}(\mathrm{x})) \mathrm{U}_{\mu}^{-1}$
For $x \neq 0$, we denote also
$\tilde{Q}_{\mu}(\mathrm{x})=\mathrm{Q}_{\mu}(\mathrm{x})-\frac{\alpha}{|\mathrm{x}+\mu \mathrm{v}(\mathrm{x})|}$ and $\tilde{\lambda}_{\mathrm{j}}(\mathrm{x})=\lambda_{\mathrm{j}}-\frac{\alpha}{|\mathrm{x}|}, \mathrm{j} \in\{1,2,3\}$
Let $C$ ( $x$ ) be a family of continuous closed simple loop of C enclosing $\tilde{\lambda}_{\mathrm{j}}(\mathrm{x}), \mathrm{j} \in\{1,2,3\}$ and having the rest of $\sigma\left(\tilde{\mathrm{Q}}_{0}(\mathrm{x})\right)$ in its exterior. The gap condition (4) permits us to assume that:
$\min _{x \in \mathbb{R}^{3}} \operatorname{dist}\left(\gamma(\mathrm{x}), \sigma\left(\tilde{\mathrm{Q}}_{0}(\mathrm{x})\right) \geq \frac{\delta}{2}\right.$
Using the relation (6) and (H3), we can take C (x) compact in a set of C. So, we deduce from (11) the following result ${ }^{[3]}$.

## Lemma 2.1

1. $\forall \mathrm{j}, \mathrm{k} \in \quad\{1, \ldots, \mathrm{p}\}, \quad \mathrm{j} \neq \mathrm{k}, \beta \in \mathrm{IN}^{3 \mathrm{p}}, \quad$ the operators $\frac{1}{\left|\mathrm{y}_{\mathrm{j}} \pm \mathrm{x}\right|}\left(\tilde{\mathrm{Q}}_{0}(\mathrm{x})-\mathrm{z}\right)^{-1}, \quad \frac{1}{\left|\mathrm{y}_{\mathrm{j}}-\mathrm{y}_{\mathrm{k}}\right|}\left(\tilde{\mathrm{Q}}_{0}(\mathrm{x})-\mathrm{z}\right)^{-1}$ and $\partial^{\beta}\left(\tilde{\mathrm{Q}}_{0}(\mathrm{x})-\mathrm{z}\right)^{-1}$ are uniformly bounded on $L^{2}\left(\operatorname{IR}_{y}^{3 p}\right), x \in \operatorname{IR}^{3}, z \in C(x)$
2. If $\mu \in$ small enough, then for $x \in \mathbb{R}^{3}, z \in$, the operator $\left(\tilde{Q}_{\mu}(x)-z\right)^{-1}$ exists and satisfies uniformly $\left(\tilde{\mathrm{Q}}_{\mu}(\mathrm{x})-\mathrm{z}\right)^{-1}-\left(\tilde{\mathrm{Q}}_{0}(\mathrm{x})-\mathrm{z}\right)^{-1}=\mathrm{O}|\mu|$.

Now we define for $\mu \in C$ small enough, the spectral projector associated to $\tilde{\mathrm{Q}}_{\mu}$ and the interior of $\mathrm{C}(\mathrm{x})$.
$\pi_{\mu}(\mathrm{x})=\frac{1}{2 \pi} \int_{\gamma(\mathrm{x})}\left(\mathrm{z}-\tilde{\mathrm{Q}}_{\mu}(\mathrm{x})\right)^{-1}$ and $\operatorname{rg} \pi_{\mu}=1$
This projector permits us to construct the Grushin problem associated to the operator $\mathrm{P}_{\mu}^{\varsigma}$.

Problem of Grushin associated with the operator $\mathrm{P}_{\mu}^{\varsigma}$ : We begin this section by the result which is (lemma1-1 of ${ }^{[12]}$ and proposition 5-1 of ${ }^{[7]}$.

Proposition 2.2: Assume (H1), (1.7), (1.9), $(1,10)$ hold, then for $\mu \in C, z \in C$ small enough, there exist $N$ functions $\omega_{\mathrm{k}, \mu}(\mathrm{x}, \mathrm{y}) \in \mathrm{C}^{0}\left(\mathrm{IR}^{3}, \mathrm{H}^{2}\left(\mathrm{IR}^{3 \mathrm{p}}\right)\right),(\mathrm{k}=1,2,3)$, depending analytically on $\mu \in$, such that
i. $\left\langle\omega_{j, \mu} \mid \omega_{\mathrm{k}, \mu}\right\rangle_{\mathrm{L}^{\mathrm{c}}\left(\mathbb{R}^{3 \mathrm{P}}\right)}=\delta_{\mathrm{j}, \mathrm{k}}$
ii. For $|x| \geq \frac{3}{N},\left(\omega_{k, \mu}\right)_{1 \leq k \leq 3}$ form a basis of $\operatorname{Ran} \pi_{\mu}(x)$ iii. $\in \mathrm{C}^{\infty}\left(\left\{|\mathrm{x}|<\frac{2}{\mathrm{~N}}\right\}, \mathrm{H}^{2}\left(\mathrm{IR}^{3 \mathrm{p}}\right)\right)$
iv. For $|x|$ large enough, $\omega_{\mathrm{k}, \mu}(\mathrm{x})(\mathrm{x})$ is an eigen function of $Q_{\mu}(x)$ associated with $\lambda_{\mathrm{k}}(\mathrm{x}+\mu \omega(\mathrm{x}))$
We first introduce the family $\left\{\omega_{1, \mu}, \omega_{2, \mu}, \omega_{3, \mu}\right\}$ of $\operatorname{Ran} \pi_{\mu}(\mathrm{x})$ depending analytically on $\mu$ for $\mu$ small enough and normalized in $L^{2}\left(\operatorname{IR}_{y}^{3 p}\right)$ by $\left\langle\omega_{\mathrm{i}, \mu}(\mathrm{x}), \omega_{\mathrm{j}, \overline{\mathrm{L}}}(\mathrm{x})\right\rangle_{\mathrm{L}^{2}\left(\mathbb{R}_{\mathrm{y}}^{3 \mathrm{j}}\right)}=\delta_{\mathrm{ij}}$ and then we associate the two following operators

$$
\begin{aligned}
& \mathrm{R}_{\mu}^{-}: \bigoplus_{1}^{3} \mathrm{~L}^{2}\left(\mathrm{IR}^{3}\right) \rightarrow \mathrm{L}^{2}\left(\mathrm{IR}^{3 \mathrm{p}}\right) \\
& \mathrm{u}^{-}=\left(\mathrm{u}_{1}^{-}, \mathrm{u}_{2}^{-}, \mathrm{u}_{3}^{-}\right) \rightarrow \mathrm{R}_{\mu}^{-} \mathrm{u}^{-}=\sum_{\mathrm{k}=1}^{3} \mathrm{u}_{\mathrm{k}}^{-} \omega_{\mathrm{k}, \mu}(\mathrm{x}) \\
& \mathrm{R}_{\mu}^{+}=\left(\mathrm{R}_{\mu}^{-}\right)^{*}: \mathrm{L}^{2}\left(\mathrm{IR}^{3 \mathrm{p}}\right) \rightarrow \oplus_{1}^{3} \mathrm{~L}^{2}\left(\mathrm{IR}^{3}\right) \\
& \mathrm{u}={ }^{\mathrm{t}}\left(\left\langle\mathrm{u}, \omega_{\bar{\mu}, 1}\right\rangle_{\mathrm{Y}},\left\langle\mathrm{u}, \omega_{\bar{\mu}, 2}\right\rangle_{\mathrm{Y}},\left\langle\mathrm{u}, \omega_{\bar{\mu}, 3}\right\rangle_{\mathrm{Y}}\right.
\end{aligned}
$$

where ${ }^{t} A$ denote the transposed of the operator $A$, $\langle., .\rangle_{\mathrm{Y}}$ the inner product on $\mathrm{L}^{2}\left(\operatorname{IR}^{3 \mathrm{p}}\right)$ and $\left\langle., \omega_{\bar{\mu}, 1}\right\rangle_{\mathrm{Y}}$ is the adjoin of the operator $L^{2}\left(\operatorname{IR}^{n}\right) \ni v \mapsto v_{\mu, j} \in L^{2}\left(\operatorname{IR}^{n+P}\right)$,
$\mathrm{u}_{\mu, \mathrm{k}}=\mathrm{u}(\mathrm{x}+\mu \mathrm{v}(\mathrm{x}))$ and we put $\hat{\pi}_{\mu}=1-\pi_{\mu}$, where $\pi_{\mu}=\left\langle u, \omega_{\bar{\mu}, 1}\right\rangle_{\mathrm{Y}} \omega_{\mu, 1}+\left\langle\mathrm{u}, \omega_{\bar{\mu}, 1}\right\rangle_{\mathrm{Y}} \omega_{\mu, 2}+\left\langle\mathrm{u}, \omega_{\bar{\mu}, 3}\right\rangle_{\mathrm{Y}} \omega_{\mu, 3}$.

As $\mathrm{P}_{\mu}^{\varsigma}$ and $\omega_{\mu, k}, \mathrm{k}=1,2,3$ have analytic extensions with $\mu$, the Grushin problem is then defined, for $\mathrm{z} \in \mathrm{C}$, by:

$$
\mathrm{P}_{\mu}^{\varsigma}(\mathrm{z})=\left(\begin{array}{cc}
\mathrm{P}_{\mu}^{\varsigma}-\mathrm{z} & \mathrm{R}_{\mu}^{+}  \tag{12}\\
\mathrm{R}_{\mu}^{-} & 0
\end{array}\right)=\left(\begin{array}{cccc}
\mathrm{P}_{\mu}^{\varsigma}-\mathrm{z} & \omega_{1, \mu} & \omega_{2, \mu} & \omega_{3, \mu} \\
\left\langle\cdot, \omega_{1, \mu}\right\rangle_{\mathrm{Y}} & 0 & 0 & 0 \\
\left\langle., \omega_{2, \mu}\right\rangle_{\mathrm{Y}} & 0 & 0 & 0 \\
\left\langle., \omega_{3, \mu}\right\rangle_{\mathrm{Y}} & 0 & 0 & 0
\end{array}\right)
$$

which sets on $\mathrm{H}^{2}\left(\mathrm{IR}^{3 \mathrm{p}}\right) \oplus\left(\stackrel{3}{\oplus} \mathrm{~L}^{2}\left(\operatorname{IR}^{3}\right)\right)$ to $\mathrm{L}^{2}\left(\mathrm{IR}^{3 \mathrm{p}}\right) \oplus\left(\oplus^{3} \mathrm{H}^{2}\left(\operatorname{IR}^{3}\right)\right)$
The following proposition, gives the inverse of the operator (12) by using a result of Grushin problem. This is proved $\mathrm{in}^{[3,6]}$.

Proposition 2.3: $\forall \mathrm{z} \in \mathrm{C}$ close enough to $\lambda_{0}, \mathrm{P}_{\mu}^{\varsigma}$ is invertible and we can write its inverse: $\mathrm{P}_{\mu}^{\varsigma-1}=\left(\begin{array}{cc}\mathrm{X}_{\mu}^{\varsigma} & \mathrm{X}_{\mu,+}^{\varsigma} \\ \mathrm{X}_{\mu,-}^{\varsigma} & \mathrm{X}_{\mu,-+}^{\varsigma}\end{array}\right)$,
With $X_{\mu}^{\varsigma}(z)=\left(P_{\mu}^{\prime \varsigma}-z\right)^{-1} \hat{\pi}_{\mu}(x)$ where $\left(P_{\mu}^{\prime \varsigma}-z\right)^{-1}$ is the bounded inverse of the restriction of $\hat{\pi}_{\mu}\left(\mathrm{P}_{\mu}^{\varsigma}-\mathrm{z}\right)$ to $\left\{u \in H^{2}\left(\operatorname{IR}^{3(n+p)}, \hat{\pi} u=u\right\}\right.$.
$X_{\mu,+}^{\varsigma}(z)=\left(\omega_{k, \mu}-X_{\mu}^{\varsigma}(z) P_{\mu}^{\varsigma}\left(. \omega_{k, \mu}\right)\right)_{1 \leq k \leq 3}$,
$X_{\mu,-}^{\varsigma}(z)={ }^{t}\left(\left\langle\left(1-P_{\mu}^{\varsigma}(z) X_{\mu}^{\varsigma}\right)(.), \omega_{k, \bar{\mu}}\right\rangle_{1 \leq k \leq 3}\right)$ and
$\mathrm{X}_{\mu,-+}^{\varsigma}(\mathrm{z})=\left(\mathrm{z} \delta_{\mathrm{jk}}-\left\langle\left(\mathrm{P}_{\mu}^{\varsigma}-\mathrm{P}_{\mu}^{\varsigma} \mathrm{X}_{\mu}^{\varsigma}(\mathrm{x}) \mathrm{P}_{\mu}^{\varsigma}\right)\left(. \omega_{\mathrm{j}, \mu}\right), \omega_{\mathrm{j}, \bar{\mu}}\right\rangle_{\mathrm{L}^{2}\left(\mathbb{R}^{3 \mathrm{P}}\right)}\right)_{1 \leq j, \mathrm{k} \leq 3}$

## Remark 2.4

1. For $z \in C$, close enough to $\lambda_{0}$, we have $z \in \sigma\left(P_{\mu}^{\varsigma}\right)$ if and only if $\exists \mu,|\mu|$ small enough and $\operatorname{Im} \mu\rangle 0$, such that $\mathrm{z} \in \sigma_{\text {disc }}\left(\mathrm{X}_{\mu,-+}^{\varsigma}(\mathrm{z})\right)$ where $\mathrm{X}_{\mu,-+}^{\varsigma}(\mathrm{z}): \oplus_{1}^{3} \mathrm{H}^{2}\left(\mathrm{IR}^{3}\right) \rightarrow \mathrm{L}^{2}\left(\mathrm{IR}^{3}\right)$, is a pseudodifferential operator of principal symbol defined by the matrix:
$\mathrm{B}(\mathrm{x}, \xi, \mathrm{z})=\mathrm{zI}-\left(\left\langle\omega_{\mathrm{j}, \mu}(\mathrm{x}) \mid\left(\mathrm{t}_{\mu}(\xi)+\mathrm{Q}_{\mu}^{\xi}(\mathrm{x})\right) \omega_{\mathrm{k}, \mu}(\mathrm{x})\right\rangle_{\mathrm{L}^{2}\left(\mathbb{R}^{3}\right)}\right)_{1 \leq \mathrm{j}, \mathrm{k} \leq 3}$
and $t_{\mu}(\xi)$ is the principal symbol of $-h^{2} U_{\mu} \Delta_{x} U_{\mu}^{-1}$
2. $\quad z$ is a resonance of the operator $\mathrm{P}_{\mu}^{\varsigma}$ only and only if, $\exists \mu \in \mathrm{C},|\mu|$ small enough $\operatorname{Im} \mu\rangle 0$, such that: $0 \in \sigma_{\text {disc }}\left(\mathrm{X}_{\mu,-+}\right)$ or $0 \in \sigma_{\text {disc }}\left(\mathrm{F}_{\mu \mu,-+}^{\varsigma}\right)$ where $\mathrm{F}_{\mu}^{\varsigma}$ is the Feshbach operator $\left(\mathrm{F}_{\mu}^{\varsigma}=\mathrm{z}-\mathrm{X}_{-+\mu}^{\varsigma}\right)$ our goal is to takeback the initial problem to a problem on $\mathrm{L}^{2}\left(\mathrm{IR}^{3}\right) \oplus \mathrm{L}^{2}\left(\mathrm{IR}^{3}\right) \oplus \mathrm{L}^{2}\left(\mathrm{IR}^{3}\right)$.

Reduced Feshbach operator: To reduce the Feshbach operator in a matricial operator, we input:

$$
\begin{align*}
& \Phi_{\mu}^{\varsigma}=\mathrm{P}_{\mu}^{\varsigma}-\mathrm{P}_{\mu}^{\varsigma} \mathrm{X}_{\mu}^{\varsigma}(\mathrm{x}) \mathrm{P}_{\mu}^{\varsigma}  \tag{13}\\
& \mathrm{F}_{\mu}^{\varsigma}=\left(\left\langle\Phi_{\mu}^{\varsigma}\left(. \omega_{\mathrm{j}, \mu}(\mathrm{x})\right) \mid \omega_{\mathrm{k}, \bar{\mu}}(\mathrm{x})\right\rangle_{\mathrm{Y}}\right)_{1 \leq \mathrm{j}, \mathrm{k} \leq 3} \tag{14}
\end{align*}
$$

and

$$
\begin{equation*}
\Phi_{1, \mu}^{\varsigma}(\mathrm{z})=\left(\left\langle\Phi_{\mu}^{\varsigma}\left(. \omega_{1, \mu}(\mathrm{x})\right) \mid \omega_{1, \bar{\mu}}(\mathrm{x})\right\rangle\right)_{1 \leq \mathrm{j}, \mathrm{k} \leq 3} \tag{15}
\end{equation*}
$$

The following proposition give us the estimation of the resolvent of the operator (15).

Proposition 2.5: For $z \in C,|z|$ small enough, $\mu \in C,|\mu|$ small enough, the operate or $\left(\Phi_{\mu}^{1 / \varsigma}(z)-z\right)$ is bijective for $\mathrm{H}^{2}\left(\mathrm{IR}^{3}\right)$ to $\mathrm{L}^{2}\left(\mathrm{IR}^{3}\right)$. Its inverse is extended for $\mathrm{H}^{\mathrm{m}}$ in $\mathrm{H}^{\mathrm{m}+\mathrm{j}}$
$\mathrm{H}^{\mathrm{m}}=\mathrm{H}^{\mathrm{m}}\left(\mathrm{L}^{2}\left(\mathrm{IR}_{\mathrm{x}}^{\mathrm{n}}, \mathrm{L}^{2}\left(\mathrm{IR}^{\mathrm{p}}\right), \forall \mathrm{m} \in \mathrm{Z}\right.\right.$ and verify for $j=\{1,2,3\}, \mathrm{h}>0$ small enough:
$\left\|\left(\Phi_{1, \mu}^{\varsigma}(z)-z\right)^{-1}\right\|_{L\left(H^{m}, H^{m+j}\right)} \leq \frac{C(m)}{h^{j}(\operatorname{Im} \mu)}$
To prove this proposition, we first use a lemma $\mathrm{in}^{[3]}$, to prove the following lemma:

Lemma 2.6: $\forall \mathrm{m} \in \mathrm{Z}$, the operator $\mathrm{X}_{\mu}^{\varsigma}(\mathrm{z})$ is uniformely is extensible in a bounded operator on $\mathrm{H}^{\mathrm{m}}\left(\mathrm{L}^{2}\left(\mathrm{IR}_{\mathrm{x}}^{\mathrm{n}}\right), \mathrm{L}^{2}\left(\mathrm{IR}^{\mathrm{p}}\right)\right), \forall \mathrm{m} \in \mathrm{Z}$, for h$\rangle 0, \mathrm{z} \in \mathrm{Z}$ and $\mu$ $\in \mathrm{Z}$ small enough and
$\left\|\mathrm{X}_{\mu}^{\varsigma}\right\|_{\mathrm{L}\left(\mathrm{H}^{\mathrm{m}}, \mathrm{H}^{\mathrm{m}+2}\right)}=O\left(\mathrm{~h}^{-2}\right)$
See ${ }^{[3]}$ for the proof.
Lemma 2.7: We assume that
$\left\|\left(\mathrm{P}_{1, \mu}^{\varsigma}-\mathrm{z}\right)^{-1}\right\|_{\mathrm{L}^{2}\left(\mathrm{H}^{m}, \mathrm{H}^{m+j}\right)}=O\left(\frac{1}{\mathrm{~h}^{j} \operatorname{Im} \mu}\right)$
for $h\rangle 0, z \in C$ and $\mu \in C$ small enough, where
$P_{1, \mu}^{\varsigma}=-h^{2} \frac{1}{(1+\mu)^{2}} \Delta_{x}+\lambda_{1}(x+\mu v(x))-$
$h^{2} \frac{1}{(1+\mu)^{2}}\left\langle\Delta_{x}\left(. \omega_{1, \mu}(x)\left|\omega_{1, \bar{\mu}}(x)\right\rangle_{Y}-\right.\right.$
$-h^{2}\left\langle R_{\mu}\left(x, D_{x}\right)\left(. \omega_{1, \mu}(x)\left|\omega_{1, \bar{\mu}}(x)\right\rangle_{Y}\right.\right.$
$R_{\mu}\left(x, D_{x}\right)$, is an differiential operator of coefficients $\mathrm{C}^{\infty}$ 。

Proof of lemma 2.7: Using (H5) we have: $\operatorname{Im} \frac{1}{(1+\mu)^{2}} \lambda_{1}(x+\mu v(x)) \leq-\frac{\operatorname{Im} \mu}{C_{1}}$, so

$$
\left\|\left(-\mathrm{h}^{2} \frac{1}{(1+\mu)^{2}} \Delta_{\mathrm{x}}+\lambda_{1}(\mathrm{x}+\mu \mathrm{v}(\mathrm{x}))-\mathrm{z}\right)^{-1}\right\|_{\mathrm{L}\left(\mathrm{~L}^{2}\left(\mathbb{R}^{\mathrm{R}}\right)\right)} \leq \frac{\mathrm{C}_{2}}{\operatorname{Im} \mu}
$$

and we easily deduce with a simple computation that

$$
\left\|\left(\mathrm{P}_{1, \mu}^{\mathrm{s}}-\mathrm{z}\right)^{-1}\right\|_{\mathrm{L}^{2}\left(\mathrm{H}^{\mathrm{m}}, \mathrm{H}^{\mathrm{m}+j}\right)}=O\left(\frac{1}{\mathrm{~h}^{\mathrm{j}} \operatorname{Im} \mu}\right)
$$

Proof of the proposition 2.5: From (13) and (15), we have $\Phi_{1, \mu}^{\varsigma}=\left\langle\left(\mathrm{P}_{\mu}^{\varsigma}-\mathrm{P}_{\mu}^{\varsigma} \mathrm{X}_{\mu}^{\varsigma}(\mathrm{z}) \mathrm{P}_{\mu}^{\varsigma}\left(. \omega_{1, \mu}(\mathrm{x})\left|\omega_{1, \bar{\mu}}(\mathrm{x})\right\rangle\right.\right.\right.$, then we subtitue $P_{\mu}^{\varsigma}$ from (7) with
$\mathrm{U}_{\mu} \Delta_{\mathrm{x}} \mathrm{U}_{\mu}^{-1}=\frac{1}{(1+\mu)^{2}} \Delta_{\mathrm{x}}+\mathrm{R}_{\mu}\left(\mathrm{x}, \mathrm{D}_{\mathrm{x}}\right)$, where $\mathrm{R}_{\mu}\left(\mathrm{x}, \mathrm{D}_{\mathrm{x}}\right)$
is a second order differential operator with $\mathrm{C}^{\infty}$ coefficients in ${ }^{x}$ with compact support, analytic in $\mu$ and whose derivative of any kind compared to x are $O(|\mu|)$ : and we put
$\Lambda_{\mu}^{\varsigma}=\frac{1}{(1+\mu)^{4}}\left\langle\Delta_{\mathrm{x}} X_{\mu}^{\varsigma} \Delta_{\mathrm{x}}\left(. \omega_{1, \mu}(\mathrm{x})\right), \omega_{1, \bar{\mu}}(\mathrm{x})\right\rangle_{\mathrm{Y}}+$
$+\frac{1}{(1+\mu)^{2}}\left\langle\begin{array}{l}\left(R_{\mu}\left(x, D_{x}\right) X_{\mu}^{\varsigma} \Delta_{x}+\Delta_{x} X_{\mu}^{\varsigma} R_{\mu}\left(x, D_{x}\right)\right) \\ \left(. \omega_{1, \mu}(x)\right), \omega_{1, \bar{\mu}}(x)\end{array}\right\rangle_{Y}$.
Using the fact that
$\hat{\pi}_{\mu} \omega_{1, \mu}=0, X_{\mu}^{\varsigma}=\hat{\pi}_{\mu} X_{\mu}^{\varsigma} \hat{\pi}_{\mu},\left\langle\omega_{1, \mu}, \omega_{1, \bar{\mu}}\right\rangle=1$, we have: $\Phi_{1, \mu}^{\varsigma}(\mathrm{z})=\breve{\mathrm{P}}_{1, \mu}^{\varsigma}-\mathrm{h}^{4} \Lambda_{\mu}^{\varsigma}$, where
$\breve{\mathrm{P}}_{1, \mu}^{\varsigma}=-\mathrm{h}^{2} \frac{1}{(1+\mu)^{2}} \Delta_{\mathrm{x}}+\lambda_{1}(\mathrm{x}+\mu \mathrm{v}(\mathrm{x}))$
$-\frac{1}{(1+\mu)^{2}}\left\langle\Delta_{\mathrm{x}}\left(. \omega_{1, \mu}(\mathrm{x})\left|\omega_{1, \bar{\mu}}(\mathrm{x})\right\rangle_{\mathrm{Y}}\right.\right.$
$-\mathrm{h}^{2}\left\langle\mathrm{R}_{\mu}\left(\mathrm{x}, \mathrm{D}_{\mathrm{x}}\right)\left(. \omega_{1, \mu}(\mathrm{x})\left|\omega_{1, \bar{\mu}}(\mathrm{x})\right\rangle_{\mathrm{Y}}\right.\right.$

We have $\mathrm{R}_{\mathrm{x}}\left(\mathrm{x}, \mathrm{D}_{\mathrm{x}}\right)$ bounded, so $\Lambda_{\mu}^{\varsigma}$ is $O\left(\mathrm{~h}^{2}\right)$ from $\mathrm{H}^{\mathrm{m}}$ to $\mathrm{H}^{\mathrm{m}}$ and we also see from (H5) and lemma2.6 that: for h small enough, $\left\|\left(\mathrm{P}_{1, \mu}^{\varsigma}-\mathrm{z}\right)^{-1}\right\|_{\mathrm{L}\left(\mathrm{L}^{2}\right)}=O\left(\frac{1}{\operatorname{Im} \mu}\right)$, then, we deduce
$\left\|\left(\breve{\mathrm{P}}_{1, \mu}^{s}-\mathrm{z}\right)^{-1}\right\|_{L^{2}\left(\mathrm{H}^{\mathrm{m}}, \mathrm{H}^{\mathrm{m}+\mathrm{j}}\right)}=O\left(\frac{1}{\mathrm{~h}^{j} \operatorname{Im} \mu}\right)$. Finally we have:
$\left\|\left(\Phi_{1, \mu}^{\varsigma}(\mathrm{z})-\mathrm{z}\right)^{-1}\right\|_{\mathrm{L}\left(\mathrm{H}^{\mathrm{m}}, \mathrm{H}^{\mathrm{m}+j}\right)}=O\left(\frac{1}{\mathrm{~h}^{j} \operatorname{Im} \mu}\right)$

## Proof of theorems

Proof of theorem 2.1: Proposition3.5 permits us to reduce the Feshbach operator $\mathrm{F}_{\mu}^{\varsigma}$ in a matricial operator
$2 \mathrm{x} 2, \mathrm{~A}_{\mu}^{\varsigma} \quad$, where $\mathrm{A}_{\mu}^{\varsigma}=\left\{\left\langle\Phi_{\mu}^{\varsigma}\left(. \omega_{\mathrm{i}, \mu}\right)+\mathrm{T}_{\mu}^{\mathrm{j}}\left(. \omega_{1, \mu}\right), \omega_{1, \bar{\mu}}\right\rangle_{\mathrm{Y}}\right\}_{\mathrm{i}, \mathrm{j}=2,3}$
Now, we consider a solution $\alpha=\alpha_{1} \oplus \alpha_{2} \oplus \alpha_{3} \in \mathrm{~L}^{2}\left(\mathrm{IR}^{\mathrm{n}}\right) \oplus \mathrm{L}^{2}\left(\mathrm{IR}^{\mathrm{n}}\right) \oplus \mathrm{L}^{2}\left(\mathrm{IR}^{\mathrm{n}}\right)$ of the equation: $\mathrm{F}_{\mu}^{\varsigma}(\mathrm{z}) \alpha=\mathrm{z} \alpha$
The operators $T_{\mu}^{\mathrm{j}}$ are defined by: $\mathrm{T}_{\mu}^{\mathrm{j} \varsigma}(\mathrm{z}) \alpha_{\mathrm{j}}=-\left(\Phi_{\mu}^{1 \varsigma}(\mathrm{z})-\mathrm{z}\right)^{-1}\left\{\left\langle\Phi_{\mu}^{\varsigma}\left(\alpha_{\mathrm{j}} \omega_{\mathrm{j}, \mu}, \omega_{\mathrm{j}, \bar{\mu}}\right\rangle_{\mathrm{Y}}\right\}_{\mathrm{j}=2,3}\right.$,
hence, the spectral study of the Feshbach $\mathrm{F}_{\mu}^{\varsigma}$ becomes the study of the operator $A_{\mu}^{\varsigma}$ on $L^{2}\left(\operatorname{IR}^{n}\right) \oplus L^{2}\left(\operatorname{IR}^{n}\right)$ by: $\alpha_{1}=-\left(\Phi_{\mu}^{\text {Ls }}(\mathrm{z})-\mathrm{z}\right)^{-1}=\left\{\left\langle\Phi_{\mu}^{\varsigma}\left(\alpha_{2} \omega_{2, \mu}, \omega_{2, \bar{\mu}}\right\rangle_{\mathrm{Y}}+\left\langle\Phi_{\mu}^{\varsigma}\left(\alpha_{2} \omega_{3, \mu}, \omega_{3, \bar{\mu}}\right\rangle_{\mathrm{Y}}\right\}\right.\right.$
Then the eigenvalues equation of $\mathrm{F}_{\mu}^{\varsigma}(\mathrm{z})$ becomes: $\left\{\begin{array}{c}\alpha_{1}=\left(\mathrm{T}_{\mu}^{2 \zeta}(\mathrm{z}) \oplus \mathrm{T}_{\mu}^{3 \zeta}(\mathrm{z})\right)\left(\alpha_{2} \oplus \alpha_{3}\right) \\ \mathrm{A}_{\mu}^{\varsigma}(\mathrm{z})\left(\alpha_{2} \oplus \alpha_{3}\right)=\mathrm{z}\left(\alpha_{2} \oplus \alpha_{3}\right)\end{array}\right.$
So we establish easily
$\mathrm{A}_{\mu}^{\varsigma}=-\mathrm{h}^{2} \frac{1}{(1+\mu)^{2}} \Delta_{\mathrm{x}}+\mathrm{M}_{\mu}^{\varsigma}+\tilde{R}_{\mu}^{\varsigma}$, where $\mathrm{M}_{\mu}^{\varsigma}$ is a diagonal matrix outside
of $\mathrm{K}_{2 \delta_{0}}$ and it equal to:
$\mathbf{M}_{\mu}^{\varsigma}=\left\{\left\langle\mathrm{Q}_{\mu}^{\varsigma}(\mathrm{x})\left(. \omega_{\mathrm{i}, \mu}\right) \mid \omega_{\mathrm{j}, \bar{\mu}}\right\rangle_{\mathrm{Y}}\right\}_{\mathrm{i}, \mathrm{j}=2,3}$
$=\left(\begin{array}{cc}\lambda_{2}(\mathrm{x}+\mu \mathrm{v}(\mathrm{x})) & 0 \\ 0 & \lambda_{3}(\mathrm{x}+\mu \mathrm{v}(\mathrm{x}))\end{array}\right)$
where $\lambda_{2}(x+\mu v(x)), \lambda_{3}(x+\mu v(x))$ are the eigenvalues of $\mathrm{Q}_{\mu}^{\varsigma}, \forall \mathrm{x} \in \mathrm{IR}-\{0\}$
The remainder
$\left\|\tilde{\mathrm{R}}_{\mu}^{\varsigma}(\mathrm{z}, \mathrm{h})\right\|_{\mathrm{L}\left(\mathrm{H}^{\mathrm{m}} \oplus \mathrm{H}^{\mathrm{m}}, \mathrm{H}^{\mathrm{m}-1} \oplus \mathrm{H}^{\mathrm{m}-1}\right.}=O\left(\mathrm{~h}^{2}\right), \forall \mathrm{m} \in \mathrm{Z}$ uniformly
for $h>0$ and $z \in C$ closed to $\lambda_{0}$
At the end we prove the second result. To describe it, we apply a technical of Briet Combs Duclos ${ }^{[13]}$.
Let $\mathrm{J}_{\mathrm{i}} \in \mathrm{C}_{0}^{\infty}\left(\left|\mathrm{x}-\mathrm{x}_{0}\right| \leq \delta\right),(\delta\rangle 0$ fixed small enough and $x_{0}$ a point of maximum) and $J_{e} \in C^{\infty}\left(I^{n}\right)$ such that: $\mathrm{J}_{\mathrm{i}}=1$ near $\mathrm{x}_{0}$ and $\mathrm{J}_{\mathrm{i}}^{2}+\mathrm{J}_{\mathrm{e}}^{2}=1$
$J$ is an identification mapping such that:

$$
\begin{gathered}
\mathrm{J}: \mathrm{L}^{2}\left(\mathrm{IR}^{\mathrm{n}}\right) \oplus \mathrm{L}^{2}\left(\sup \mathrm{pJ} \mathrm{~J}_{\mathrm{e}}\right) \rightarrow \mathrm{L}^{2}\left(\mathrm{IR}^{\mathrm{n}}\right) \\
\mathrm{J}(\mathrm{u} \oplus \mathrm{w})=\mathrm{J}_{\mathrm{i}} \mathrm{u}+\mathrm{J}_{\mathrm{e}} \mathrm{w}
\end{gathered}
$$

It is easily proved that: $J J^{*}=1_{\mathrm{L}^{2}\left(\mathbb{R}^{\mathrm{n}}\right)}$
Now, if we note $\mathrm{P}_{\mu}^{\Omega}$ the Dirichlet realisation of $\mathrm{P}_{\mu}^{\varsigma}$ on $\Omega$, on $\Omega, \mathrm{x}=\mathrm{v}(\mathrm{x})$ and the distorsion $\mathrm{x}+\mu \mathrm{v}(\mathrm{x})=\mathrm{xe}^{\theta}$,
is an analytic dilatation (whose Dirichlet realisation is the operator $\mathrm{H}_{\mu}^{\varsigma}$ obtained for $\left.\varsigma=1\right)$ ). We set

$$
\mathrm{H}_{\theta}^{\mathrm{i}}=-\mathrm{h}^{2} \mathrm{e}^{-2 \theta} \Delta+\left\langle\lambda_{2}^{\prime \prime}\left(\mathrm{x}_{0}\right)\left(\mathrm{x}-\mathrm{x}_{0}\right),\left(\mathrm{x}-\mathrm{x}_{0}\right)\right\rangle \mathrm{e}^{2 \theta}
$$

$$
\mathrm{H}_{\theta}=\mathrm{P}_{\theta}^{2}=-\mathrm{h}^{2} \mathrm{e}^{-2 \theta} \Delta+\lambda_{2}\left(\mathrm{xe}^{\theta}\right)
$$

$\mathrm{H}_{\theta}^{\mathrm{e}}=\left.\mathrm{H}_{\theta}\right|_{\mathrm{L}^{2}\left(\text { supp } \mathrm{J}_{\mathrm{e}}\right)}$, with Dirichlet conditions on $\partial \sup \mathrm{pJ}{ }_{\mathrm{e}}$
 $\left(\mathrm{H}_{\theta}^{\mathrm{e}}-\mathrm{z}\right)^{-1}$ is uniformly bounded for $|\mathrm{z}|$ and $h$ small enough.
Before we prove the second result, we introduce the following lemma
Lemma 3.2: For all $\mathrm{p} \in[0,1],\left\||\mathrm{x}|^{\mathrm{p}}\left(\mathrm{H}_{\theta}^{\mathrm{i}}-\mathrm{z}\right)^{-1}\right\|_{L\left(\mathrm{~L}^{2}\right)}=$ $O\left(\mathrm{~h}^{\frac{\mathrm{p}}{2}-\frac{1}{2}}\right)$, uniformly for z outside of $\gamma(\mathrm{x})$ $\mathrm{z} \in\left[-\varepsilon-\mathrm{x}_{0}, \mathrm{C}_{0} \mathrm{~h}-\mathrm{x}_{0}\right]+\mathrm{i}\left[-\varepsilon-\mathrm{x}_{0}, \mathrm{C}_{0} \mathrm{~h}-\mathrm{x}_{0}\right]$,
$\operatorname{Im} \theta \geq 0$, and $h$ small enough.

Proof of lemma 3.2: If we put $y=\frac{x-x_{0}}{\sqrt{h}}$, we can write $\mathrm{H}_{\mathrm{i}}^{\theta}$ :
$\mathrm{H}_{\mathrm{i}}^{\theta}=\mathrm{hH}_{\mathrm{i}}^{0}$
where $\mathrm{H}_{\mathrm{i}}^{0}=-\mathrm{e}^{-2 \theta} \Delta_{\mathrm{y}}+\frac{1}{2}\left\langle\lambda "\left(\mathrm{x}_{0}\right) \mathrm{y}, \mathrm{y}\right\rangle+\mathrm{h}^{-1} \mathfrak{J}(\varepsilon)$,
with $\mathfrak{J}(\varepsilon)=\varepsilon\left(1+\left(\mathrm{x}-\mathrm{x}_{0}\right) \mathrm{e}^{\theta}+\frac{1}{2}\left(\mathrm{x}-\mathrm{x}_{0}\right)^{2} \mathrm{e}^{2 \theta}\right)$
It is enough to show that, for $\theta=i \alpha, \alpha \geq 0$, small enough. We have from (16)

$$
\begin{equation*}
|x|^{p}\left(H_{\theta}^{i}-z\right)^{-1}=h^{\frac{p}{2}-\frac{1}{2}}|y|^{2}\left(H_{\theta}^{0}-\mathrm{zh}^{-1}\right)^{-1} \tag{17}
\end{equation*}
$$

and the eigenvalues of the operator $\mathrm{H}_{\mathrm{i}}^{0}$ in
$\left.]-\infty, C_{0}-x_{0}\right]+i \operatorname{IR}$ are $e_{1}, \ldots, e_{N}$.
We distinguish three cases for $\mathrm{p}=0$.
1/ If $z \in\left[-\mathrm{Ch}-\mathrm{x}_{0}, \mathrm{C}_{0} \mathrm{~h}-\mathrm{x}_{0}\right]+\mathrm{i}\left[-\mathrm{Ch}-\mathrm{x}_{0}, \mathrm{C}_{0} \mathrm{~h}-\mathrm{x}_{0}\right]$ : we deduce for all C $0,\left(\mathrm{H}_{\theta}^{0}-\mathrm{zh}^{-1}\right)^{-1}$ is bounded on $\mathrm{L}^{2}$ uniformly for $z$ outside the $\gamma_{j}$, so (17) is verified.
2/ If $z \in\left[-\varepsilon-x_{0}, C_{0} h-x_{0}\right]+i\left[-\varepsilon-x_{0}, C h-x_{0}\right]:$ then for $u \in C_{0}^{\infty}\left(\operatorname{RR}^{n}\right)$ :
$e^{2 \theta} H_{\theta}^{0}=-\Delta y+\frac{1}{2}\left\langle\lambda "\left(x_{0}\right) y, y\right\rangle e^{4 \theta}+$
$h^{-1}\left(z+\varepsilon\left(1+\left(x-x_{0}\right) e^{3 \theta}+\frac{1}{2}\left(x-x_{0}\right)^{2} e^{4 \theta}\right)\right.$
and
$\operatorname{Im}\left\langle\mathrm{e}^{2 \theta}\left(\mathrm{H}_{\theta}^{0}-\mathrm{zh}^{-1}\right) \mathrm{u}, \mathrm{u}\right\rangle=\frac{1}{2} \sin 4 \alpha\left\langle\left\langle\lambda \lambda^{\prime \prime}\left(\mathrm{x}_{0}\right) \mathrm{y}, \mathrm{y}\right\rangle \mathrm{u}, \mathrm{u}\right\rangle-$
$-\left[\mathrm{h}^{-1}\left(\mathrm{z} \sin 2 \alpha+\mathrm{Im} \mathrm{z} \cos 2 \alpha+\mathrm{h}^{-\frac{1}{2}}(\mathrm{y} \sin 3 \alpha+\mathrm{z} \cos 4 \alpha)\right]\|\mathrm{u}\|^{2}\right.$
We take particularly $\alpha$ small enough and $C$ large enough such that: $\mathrm{C} \cos 2 \alpha>\mathrm{C}_{0} \sin 2 \alpha$
At least we obtained
$\left|\left\langle\mathrm{e}^{2 \theta}\left(\mathrm{H}_{\theta}^{0}-\mathrm{zh}^{-1}\right) \mathrm{u}, \mathrm{u}\right\rangle\right| \geq \mathrm{h}^{-\frac{1}{2}}\left(\mathrm{x}_{0} \sin 2 \alpha+\mathrm{y} \sin 3 \alpha\right)\|\mathrm{u}\|^{2}$ so
the result is also verified. It remain the case:
3/ If $z \in\left[-\varepsilon-x_{0},-C h-x_{0}\right]+i\left[-C h-x_{0}, C_{0} h-x_{0}\right]$ :
$\operatorname{Re}\left\langle\mathrm{e}^{2 \theta}\left(\mathrm{H}_{\theta}^{0}-\mathrm{zh}^{-1}\right) \mathrm{u}, \mathrm{u}\right\rangle$
$\geq \mathrm{h}^{-\frac{1}{2}}(\operatorname{Rez} \cos 4 \alpha-\mathrm{Im} \mathrm{z} \sin 2 \alpha+\mathrm{y} \cos 3 \alpha)$
we deduce the estimation when $C>\mathrm{C}_{0}, \alpha$ small enough and $C$ large enough such that $\cos 4 \alpha\rangle \sin 2 \alpha$
Now we consider the case when $\mathrm{p} \neq 0$,
$e^{2 \theta}\left(H_{\theta}^{0}-z h^{-1}\right)=-\Delta+\frac{1}{2} e^{4 \theta}\left\langle\lambda "\left(x_{0}\right) y, y\right\rangle$ and
$-\mathrm{zh}^{-1} \mathrm{e}^{2 \theta}+\mathrm{h}^{-1} \mathrm{e}^{2 \theta} \mathfrak{J}(\varepsilon)$
$\left\|-\Delta+\frac{1}{2} \mathrm{e}^{4 \theta}\left\langle\lambda "\left(\mathrm{x}_{0}\right) \mathrm{y}, \mathrm{y}\right\rangle-\mathrm{zh}^{-1} \mathrm{e}^{2 \theta}+\mathrm{h}^{-1} \mathrm{e}^{2 \theta} \mathfrak{J}(\varepsilon)\right\|$
$\geq\left\|\frac{1}{2} \cos 4 \alpha\left\langle\lambda "\left(x_{0}\right) y, y\right\rangle u\right\|_{L^{2}} \geq \frac{1}{C}|y|^{2}\|u\|_{L^{2}}$
if we put $u=\left(H_{\theta}^{0}-\mathrm{zh}^{-1}\right)^{-1} v$ the result is deduced from a priori standard estimation.

Proof of theorem 1.2: We put $\mathrm{H}_{\theta}^{\mathrm{d}}=\mathrm{H}_{\theta}^{\mathrm{i}} \oplus \mathrm{H}_{\theta}^{\mathrm{e}}$ and $\Pi=H_{\theta} J-\mathrm{JH}_{\theta}^{\mathrm{d}}$, for z outside the spectrum of $\mathrm{H}_{\theta}$, with a simple calculation we obtain:
$\left(\mathrm{H}_{\theta}-\mathrm{z}\right)^{-1}=\mathrm{J}\left(\mathrm{H}_{\theta}^{\mathrm{d}}-\mathrm{z}\right)^{-1} \mathrm{~J}^{*}\left(1+\Pi\left(\mathrm{H}_{\theta}^{\mathrm{d}}-\mathrm{z}\right)^{-1} \mathrm{~J}^{*}\right)^{-1}$
Using the lemma3.2 (with $\mathrm{p}=2$ ) and the lemma3.1of Briet Combs Duclos ${ }^{[13]}$, we can easily prove that: $\exists \beta\langle 1$ such that
$\left\|\Pi\left(\mathrm{H}_{\theta}^{\mathrm{d}}-\mathrm{z}\right)^{-1} \mathrm{~J}^{*}\right\| \leq \beta$
Using the lemma3.2 and (19), we obtain from (18) $\left\|\left(\mathrm{H}_{\theta}-\mathrm{z}\right)^{-1}\right\| \leq \mathrm{C}\left\|\left(\mathrm{H}_{\theta}^{\mathrm{d}}-\mathrm{z}\right)^{-1}\right\|$, finally the result is obtained from lemma3.2 and remark3.1
